this volume comprises the proceedings of the nato advanced research workshop on the science
and engineering of 1 and 0 dimensional semiconductors held at the university of cadiz from 29th
march to 1st april 1989 under the auspices of the nato international scientific exchange program
there is a wealth of scientific activity on the properties of two dimensional semiconductors arising
largely from the ease with which such structures can now be grown by precision epitaxy
techniques or created by inversion at the silicon silicon dioxide interface only recently however
has there burgeoned an interest in the properties of structures in which carriers are further
confined with only one or in the extreme zero degrees of freedom this workshop was one of the
first meetings to concentrate almost exclusively on this subject that the attendance of some forty
researchers only represented the community of researchers in the field testifies to its rapid
expansion which has arisen from the increasing availability of technologies for fabricating
structures with small enough sub μm dimensions part i of this volume is a short section on
important topics in nanofabrication it should not be assumed from the brevity of this section that
there is little new to be said on this issue rather that to have done justice to it would have
diverted attention from the main purpose of the meeting which was to highlight experimental and
theoretical research on the structures themselves

vol 12 includes under the same cover the society s year book for 1912
