the graphical user interface gui as the most prevailing type of user interface ui in today s interactive applications restricts the interaction with a computer to the visual modality and is therefore not suited for some users e g with limited literacy or typing skills in some circumstances e g while moving around with their hands or eyes busy or when the environment is constrained e g the keyboard and the mouse are not available in order to go beyond the gui constraints the multimodal mm uis appear as paradigm that provide users with great expressive power naturalness and flexibility in this thesis we argue that developing mm uis combining graphical and vocal modalities is an activity that could benefit from the application of a methodology which is composed of a set of models a method manipulating these models and the tools implementing the method therefore we define a design space based method that is supported by model to model colored transformations in order to obtain mm uis of information systems the design space is composed of explicitly defined design options that clarify the development process in a structured way in order to require less design effort the feasibility of the methodology is demonstrated through three case studies with different levels of complexity and coverage in addition an empirical study is conducted with end users in order to

measure the relative usability level provided by different design decisions
